**Location – Salt Creek Prospect,
 Eyre Peninsula,
 South Australia**

NEW RARE EARTH PROSPECT UNCOVERED AT THE EYRE PENINSULA PROJECT

- Over 3,000 ppm total rare earth element oxides in weathered horizon from surface (Ion Adsorption Clay setting)
- Enriched in high value rare earths used in permanent magnets in wind turbines and electric vehicles
- Enriched in high value heavy rare earths
- Mineralisation drilled over 1.1 km in north-south direction
- Open in multiple directions
- Emerging REE potential across the region
- Metallurgical test work program initiated to determine recoveries

iTech Minerals Ltd (ASX: **ITM**, iTech or **Company**) has identified significant rare earth element mineralisation in the clay rich, weathering profile at the Salt Creek Prospect on the Eyre Peninsula, South Australia (Fig. 1). The rare earths display significant enrichment of neodymium and praeidium (~23% Nd+Pr), which are critical in the production of permanent magnets for electric vehicles and renewable energy. They also display significant enrichment in desirable heavy rare earth element oxides (~39% HREO) which command a premium price.

Drilling was undertaken by Archer Materials in 2011 while exploring for manganese and returned significant REE results including:

- **SRC11-002 – 30 m @ 511 ppm TREO from 3m**
 - including 2m @ 1306 ppm TREO from 4m
 - and 3m @ 1327 ppm TREO from 30m
- **SRC11-003 – 13m @ 1047 ppm TREO from 0m**
- **SRC11-004 – 6m @ 1507 ppm TREO from 16m**
 - and 4m @ 1307 ppm TREO from 30m
- **SRC11-006 – 12m @ 1698 ppm TREO from 0m**
 - including 4m @ 3093 ppm TREO from 0m
 - and 5m @ 1439 ppm TREO from 8m
- **SRC11-012 – 32m @ 891 ppm TREO from 6m**
 - including 16m @ 1137 ppm TREO from 10m
 - and 2m @ 1079 ppm TREO from 35m
- **SRC11-014 – 3m @ 1015 ppm TREO from 0m**
- **SRC11-015 – 8m @ 790 ppm TREO from 4m**
 - including 4m @ 1157 ppm TREO from 8m
- **SRC11-016 – 23m @ 1065 ppm TREO from 12m**
 - including 4m @ 3019 ppm TREO from 20m
 - and 4m @ 1090ppm TREO from 28m

“The Salt Creek Prospect confirms the prospectivity of the Eyre Peninsula for REE. With over 1,400km² of ground in the region, and a huge amount of historical data from Archer Materials to guide us, we are in a very strong position to capitalise on this potential.”

- Managing Director Mike Schwarz –

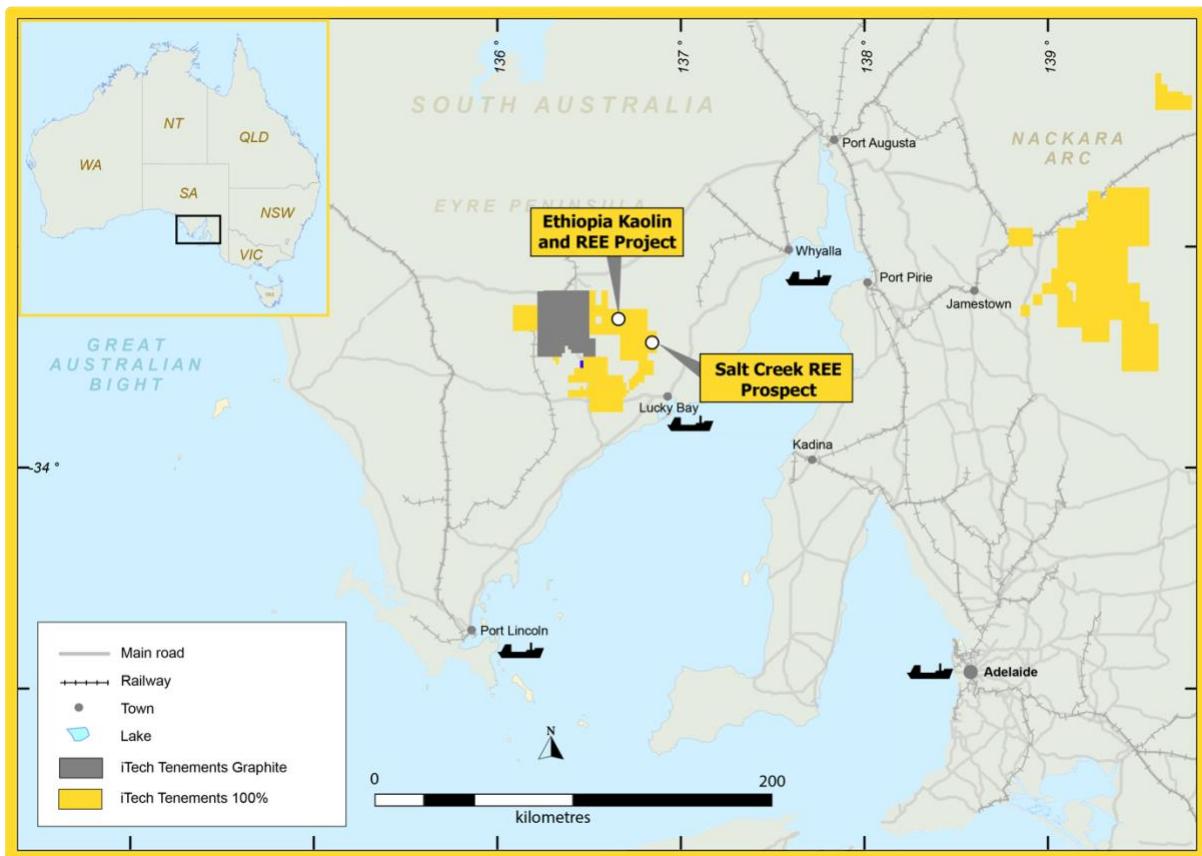

Figure 1. Location of the Salt Creek and Ethiopia Prospects – Eyre Peninsula, South Australia

Salt Creek REE Potential

A detailed review of historical data, from drilling undertaken by Archer Materials Ltd in 2011, identified thick intervals of up to 32m of REE rich, clay dominant material, over an area extending over 1 km in a north-south direction (Fig. 4). Of the 19 drill holes drilled, 15 holes had high levels of REE mineralisation consistent with ion adsorption clay (IAC) style mineralisation. Significant results from the drilling are presented in Table 1. A full list of results can be found in Appendix 1. The results show thick intervals of clay rich material near surface with high levels of total rare earth element oxides (TREO) (Fig 3). This confirms the Company's view that the Eyre Peninsula Projects have significant potential for IAC style deposits. Results from this work will help guide the Company's upcoming drilling programs to focus on known areas of mineralisation.

The 2011 Archer Materials drilling program was targeting manganese rich horizons within Paleoproterozoic Hutchison Group Metasediments. As a matter of good process, they also undertook multielement analysis including the full suite of REEs. At the time IAC REE mineralisation was relatively unknown outside of southern China and the demand for REE were not as strong as today, so the implications were not fully realised. With limited success finding manganese mineralisation at Salt Creek the project was mothballed. iTech considers this a prime example of the value of the high-quality exploration dataset inherited from Archer Materials and how the Company can find significant value in the 10+ years of exploration undertaken across the tenements at negligible cost.

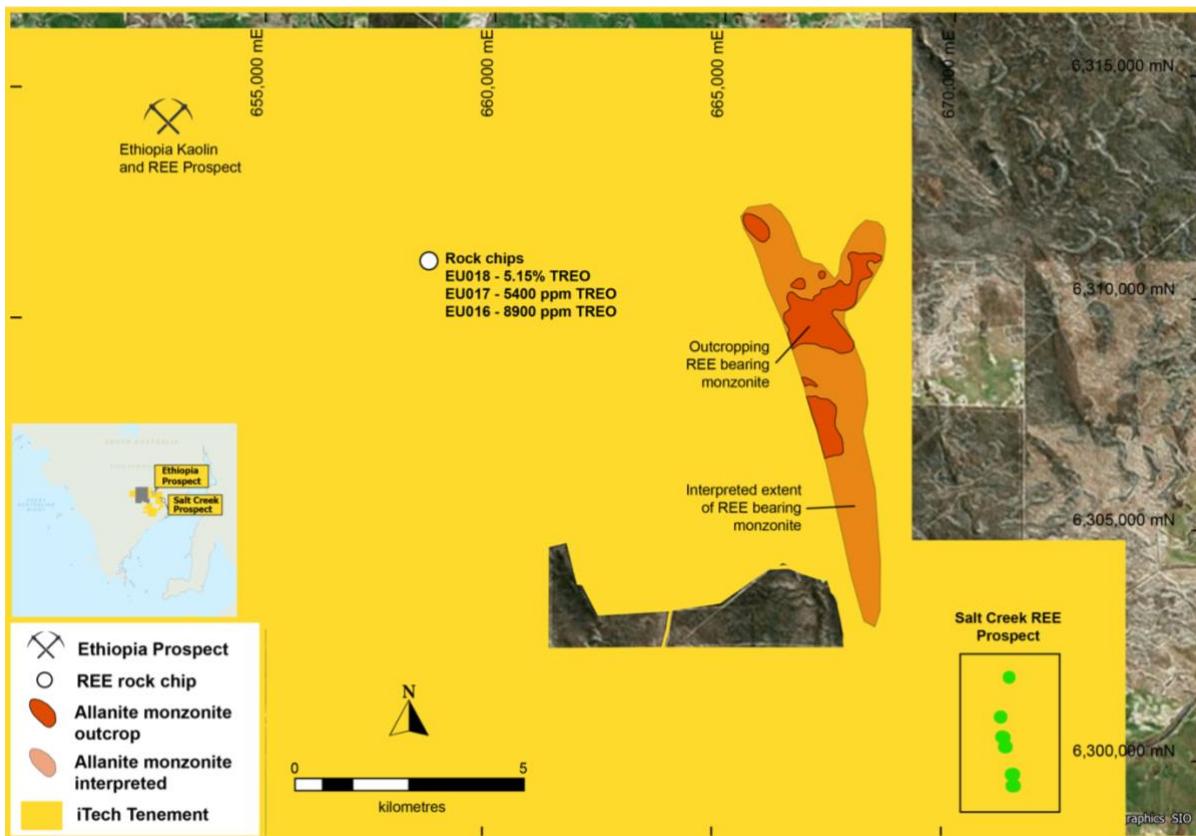

Figure 2. Cross section through the Salt Creek Prospect – Eyre Peninsula, South Australia (ASX Release, 21-Oct-21, Rare Earth Potential Identified at Kaolin Project)

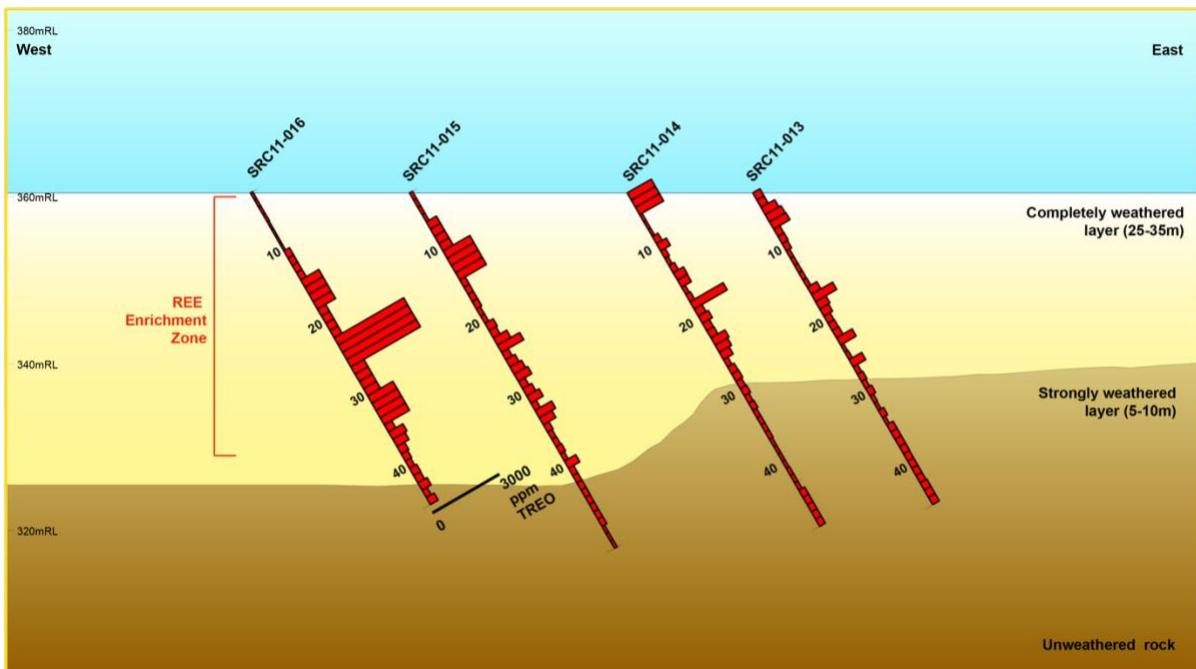

Figure 3. Cross section through the Salt Creek Prospect – Eyre Peninsula, South Australia

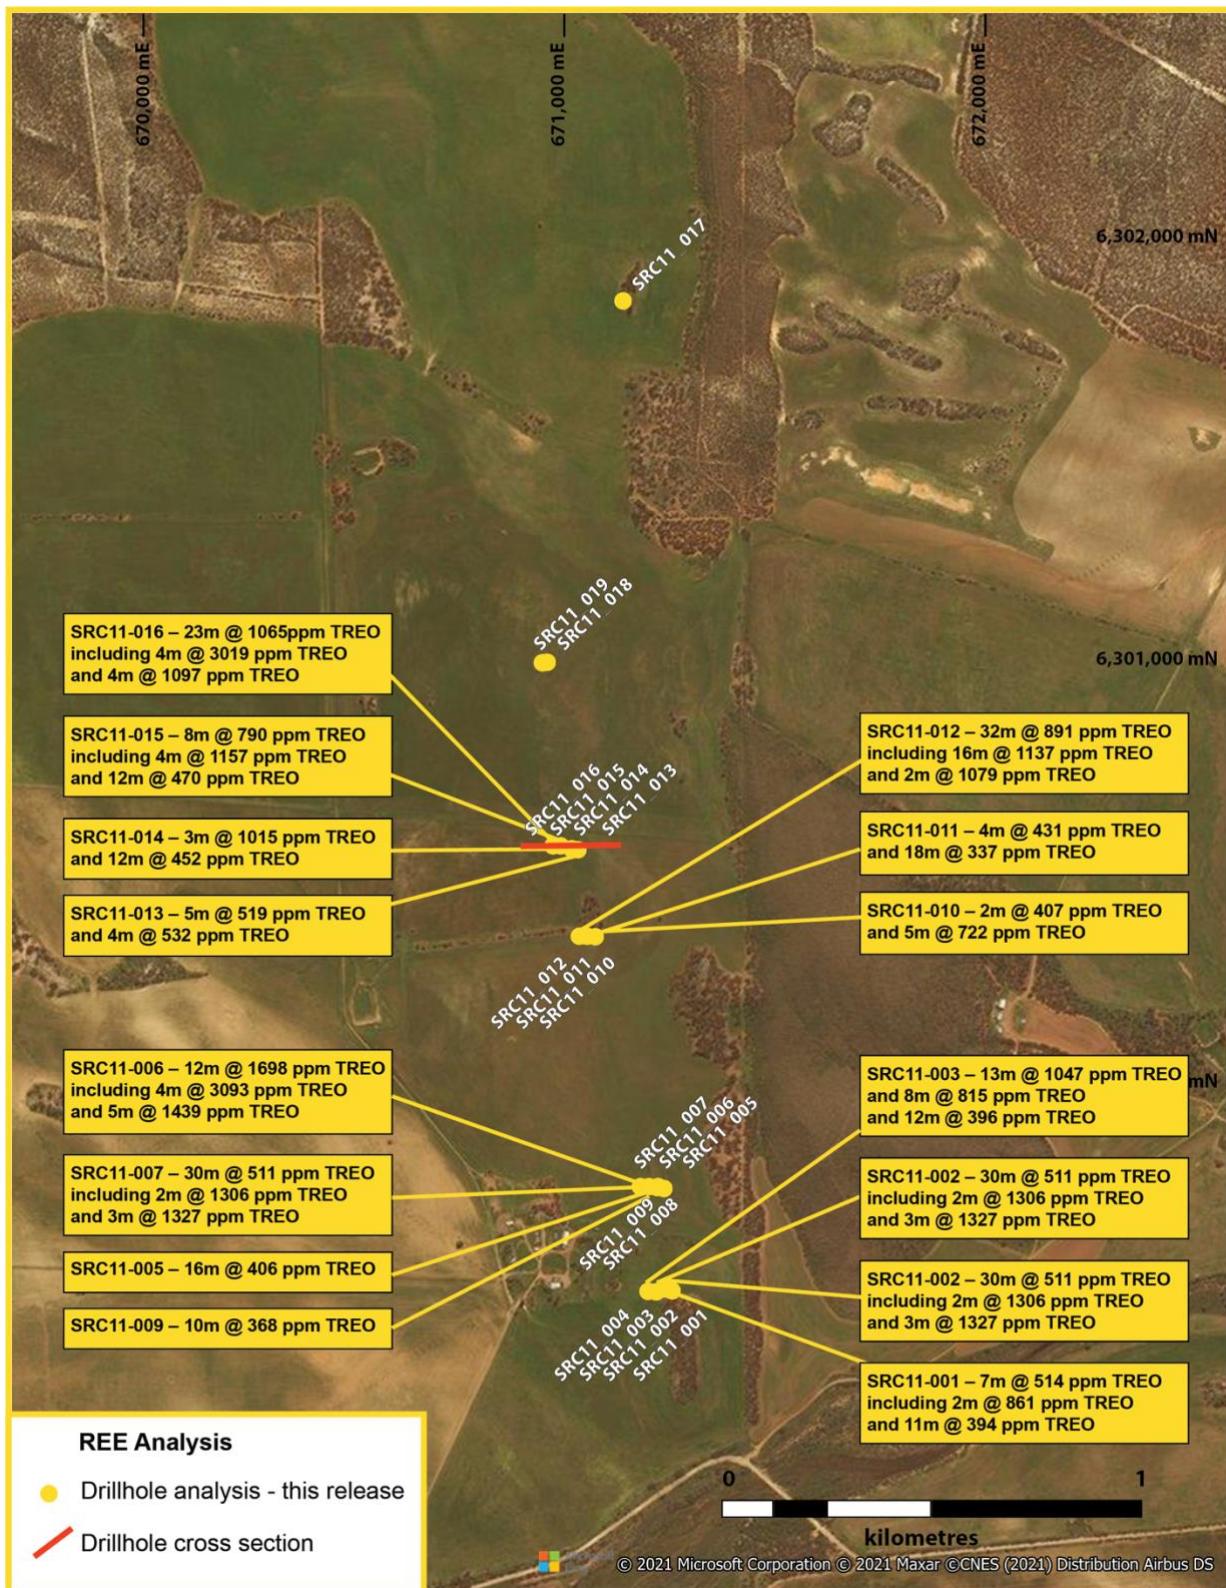

Figure 4. Location of drill holes and significant REE results, Salt Creek Prospect – Eyre Peninsula, South Australia

Salt Creek Prospect comparison with Ethiopia Prospect

The weathered host rocks at the Salt Creek Prospect are dominated by clastic and chemical metasediments of the Paleoproterozoic Hutchison Group. At this stage, it is unclear what the source of the REEs are, but it is interesting to note that a large REE bearing monzonite (a type of granite) occurs just 3 km to the north-west of the prospect (Fig. 3). It is quite possible that equivalents of this unit intrude the metasediments at Salt Creek and create a source of REEs.

The REE grades at Salt Creek are significantly higher than those discovered at Ethiopia so far, however, results from some of the best samples from Ethiopia are yet to be received. While Salt Creek appears to have some potential for kaolin, no test work has been undertaken, and it is currently considered to have more potential as a pure IAC REE prospect.

Characteristics of REE IAC Deposits

Although ion-adsorption clay deposits are substantially lower grade than other types of lanthanide sources (e.g., carbonatites, alkaline igneous complexes, magmatic magnetite-hematite bodies, and heavy mineral deposits), the lower grade is largely offset by easier mining and lower processing costs, and the very low content of radioactive elements. These deposits are generally mined by open-pit methods and little beneficiation is required. A simple leach process using monovalent sulphate or chloride salt solutions at ambient temperature can produce a high-grade REO product.

REE's are found in soils deposited after weathering of granitic and/or REE enriched source rocks

- Occur primarily in China, but now being recognised globally.
- Sometimes called laterite deposits
- REE's are adsorbed to kaolinite, halloysite and other clay minerals
- Ore is relatively low-grade, generally only 0.05% to 0.5% REO (rare earth element oxides)
- High heavy REE enriched, which are more valuable
- Easily extractable REE can be highly profitable due to low extraction costs
- REE's leachable from clays with simple ammonium sulphate at room temperature

Next Steps

iTech has located samples from the original Salt Creek drilling program within the exploration assets acquired from Archer Materials. Representative samples from both Salt Creek and Ethiopia Prospects are being sent to the ANSTO laboratories in Sydney where they specialise in the metallurgical extraction of REE from IAC deposits. The results will give an indication of expected recoveries and whether ionic adsorption plays a significant role in the REE mineralisation style.

In the shorter term, iTech is using the new discovery to plan its upcoming drilling program across the Eyre Peninsula Kaolin and REE prospects.

ABOUT iTECH MINERALS LTD

iTech Minerals Ltd is a newly listed mineral exploration company exploring for and developing battery materials and critical minerals within its 100% owned Australian projects. The company is exploring for kaolinite-halloysite, ion adsorption clay rare earth element mineralisation and developing the Campoona Graphite Deposit in South Australia. The company also has extensive exploration tenure prospective for Cu-Au porphyry mineralisation, IOCG mineralisation and gold mineralisation in South Australia and tin, tungsten, and polymetallic Cobar style mineralisation in New South Wales.

COMPETENT PERSON STATEMENT

The information which relates to exploration results is based on and fairly represents information and supporting documentation compiled by Michael Schwarz. Mr Schwarz has sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking, to qualify as a Competent Person as defined in the 2012 edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (the JORC Code). Mr Schwarz is a full-time employee of iTech Minerals Ltd and is a member of the Australian Institute of Geoscientists and the Australian Institute of Mining and Metallurgy. Mr Schwarz consents to the inclusion of the information in this report in the form and context in which it appears.

This announcement contains results that have previously released as "Replacement Prospectus" on 19 October 2021, "Rare Earth Potential Identified at Kaolin Project" on 21 October 2021 and "Rare Earth Potential Confirmed at Kaolin Project" on 12 November 2021. iTech confirms that the Company is not aware of any new information or data that materially affects the information included in the announcement.

GLOSSARY

CREO = Critical Rare Earth Element Oxide

HREO = Heavy Rare Earth Element Oxide

IAC = Ion Adsorption Clay

LREO = Light Rare Earth Element Oxide

REE = Rare Earth Element

REO = Rare Earth Element Oxide

TREO = Total Rare Earth Element Oxides

%NdPr = Percentage amount of neodymium and praseodymium as a proportion of the total amount of rare earth elements

Table 3. Salt Creek Prospect 2011 drillhole collars

JORC 2012 EDITION - TABLE 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code Explanation	Commentary
Sampling Techniques	<ul style="list-style-type: none"> Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	<p>Archer Materials Ltd 2011 drilling</p> <ul style="list-style-type: none"> All samples were collected through a cyclone into plastic bags, composite samples were created from selected 1 metre intervals, which have been sent for chemical analyses. Composite intervals were created based upon the geology and colour. As such the composite intervals created vary in length from 2m to 5m. Composite samples weigh roughly 0.5kg for initial test work. All samples were sent to ALS laboratory in Adelaide for preparation and forwarded to Peth for multi-element analyses. All samples are crushed using LM2 mill to -4 mm and pulverised to nominal 80% passing -75 µm. The Competent Person has referenced publicly sourced information through the report and considers that sampling was commensurate with industry standards current at the time of drilling and is appropriate for the indication of the presence of mineralisation.
Drilling Techniques	<ul style="list-style-type: none"> Drill type (e.g., core, reverse circulation, open hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.). 	<ul style="list-style-type: none"> The drill type is a Reverse Circulation (RC) with a 5.25 inch face sampling hammer bit. The samples are collected after passing through a 2 tier splitter attached underneath the mounted cyclone. The drill company was Lehmann Drilling. The Competent Person has referenced publicly sourced information through the report and considers that drilling techniques was commensurate with industry standards current at the time of drilling and is appropriate for the indication of the presence of mineralisation.
Drill Sample Recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative 	<ul style="list-style-type: none"> No assessment of recoveries was documented. All efforts were made to ensure that the sample was representative. No relationship is believed to exist, but no work has been done to confirm this.

Criteria	JORC Code Explanation	Commentary
	<p>nature of the samples.</p> <ul style="list-style-type: none"> Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography. The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> All samples were geologically logged, as the hole collars were never accurately surveyed (a hand-held GPS was used) no data can be used for mineral resource estimation. Logging was qualitative and quantitative, i.e. percentages of vein material and host rock were estimated as well as noted.
Sub-Sampling Techniques and Sample Preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all cores taken. If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry. For all sample types, the nature, quality, and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> All drilling was Reverse Circulation (RC), with a face sampling hammer bit. All samples were riffle split on a 2-tiered splitter, except for those that are wet, these were speared in the bag, by laying it on the side and taking a cross cutting representative sample. Samples from 55m onwards have been wet as the volume of water is considered to be significant. Initial samples submitted for assay are composites, this material is collected from the individual split sample. No additional quality control measures were taken for the sample submission. The sample sizes are considered appropriate for the material being sampled. The Competent Person has referenced publicly sourced information through the report and considers that sampling techniques was commensurate with industry standards current at the time of drilling and is appropriate for the indication of the presence of mineralisation.
Quality of Assay Data and Laboratory Tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the 	<ul style="list-style-type: none"> Certified standards were used in the assessment of the analyses. Analyses was by ALS Perth using their ME-MS61 technique for multi-elements. AS such the digestion of REE's is not complete. The laboratory uses their own certified standards during analyses.

Criteria	JORC Code Explanation	Commentary
	<p>analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</p> <ul style="list-style-type: none"> Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. 	
Verification of Sampling and Assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> No verification of sampling, no use of twinned holes. Data is exploratory in nature and exists as excel spread sheets. No data adjustment. Rare earth element analyses were originally reported in elemental form but have been converted to relevant oxide concentrations as in the industry standard <ul style="list-style-type: none"> TREO = $\text{La}_2\text{O}_3 + \text{CeO}_2 + \text{Pr}_6\text{O}_{11} + \text{Nd}_2\text{O}_3 + \text{Sm}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Gd}_2\text{O}_3 + \text{Tb}_4\text{O}_7 + \text{Dy}_2\text{O}_3 + \text{Ho}_2\text{O}_3 + \text{Er}_2\text{O}_3 + \text{Tm}_2\text{O}_3 + \text{Yb}_2\text{O}_3 + \text{Lu}_2\text{O}_3 + \text{Y}_2\text{O}_3$ CREO = $\text{Nd}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Tb}_4\text{O}_7 + \text{Dy}_2\text{O}_3 + \text{Y}_2\text{O}_3$ LREO = $\text{La}_2\text{O}_3 + \text{CeO}_2 + \text{Pr}_6\text{O}_{11} + \text{Nd}_2\text{O}_3$ HREO = $\text{Sm}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Gd}_2\text{O}_3 + \text{Tb}_4\text{O}_7 + \text{Dy}_2\text{O}_3 + \text{Ho}_2\text{O}_3 + \text{Er}_2\text{O}_3 + \text{Tm}_2\text{O}_3 + \text{Yb}_2\text{O}_3 + \text{Lu}_2\text{O}_3 + \text{Y}_2\text{O}_3$ NdPr = $\text{Nd}_2\text{O}_3 + \text{Pr}_6\text{O}_{11}$ TREO-Ce = TREO - CeO₂ % NdPr = NdPr / TREO %HREO = HREO/TREO %LREO = LREO/TREO
Location of Data Points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drillholes (collar and downhole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> MGA94 Zone 53 grid coordinate system is used. A hand-held GPS was used to identify the sample location Quality and adequacy is appropriate for this level of exploration
Data Spacing and Distribution	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. 	<ul style="list-style-type: none"> There is no pattern to the sampling, the spacing is random, the location of the holes was determined by the land surface as no clearing was undertaken for the drill rig so many sites were unsuitable to drill. Some of these may have produced different results to the one being reported, some of the more significant electro-magnetic responses have not yet been drill tested.

Criteria	JORC Code Explanation	Commentary
	<ul style="list-style-type: none"> Whether sample compositing has been applied. 	<ul style="list-style-type: none"> Data spacing and distribution are sufficient to establish the degree of geological and grade continuity for future drill planning, but not for resource reporting. The size of the system being explored is extremely large and 3 5.25inch holes are very much an early indicator at best. Considerable area remains untested.
Orientation of Data in Relation to Geological Structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> It is believed that the drilling has intersected the geology at right angles, however, it is unknown whether the drill holes have interested the mineralisation in a perpendicular manner. The mineralised horizon is obscured by a veneer of transported material, from observations of the strike of outcrop it was believed that the mineralised structure was being drilled perpendicularly. Bedding in the area dips to the W (about 70°), there is a high angle foliation to this in places (striking NNE) in places. It is believed there is no bias has been introduced.
Sample Security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> It is assumed that best practices were undertaken at the time All residual sample material (pulps) are stored securely.
Audits or Reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> None undertaken.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code Explanation	Commentary
Mineral Tenement and Land Tenure Status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> Tenement status confirmed on SARIG. The tenements are in good standing with no known impediments.
Exploration Done by Other Parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> Relevant previous exploration has been undertaken by Shell Company of Australia Pty Ltd, Adelaide Exploration Pty Ltd and Archer Materials Ltd See body of report for details on previous exploration
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> The tenements are within the Gawler Craton, South Australia. iTech is exploring for porphyry Cu-Au, epithermal Au, kaolin and halloysite and REE deposits. This release refers to ion adsorption rare earth elements mineralisation related to lateritic weathering processes on basement rock of the Gawler Craton, in particular the Palaeoproterozoic Miltalie Gneiss and Hutchison Group Metasediments. See body of the report for description of the geology in more detail.
Drillhole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> Easting and northing of the drill hole collar Elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar Dip and azimuth of the hole 	<ul style="list-style-type: none"> Refer to Table 1 and Appendix 1, Table 3 of this report for details

Criteria	JORC Code Explanation	Commentary
	<ul style="list-style-type: none"> – Downhole length and interception depth – Hole length <ul style="list-style-type: none"> • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	
Data Aggregation Methods	<ul style="list-style-type: none"> • In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<ul style="list-style-type: none"> • iTech Minerals REE intervals were aggregated using a lower cut-off of 300ppm TREO with no upper limit applied. • Internal dilution was no more than 2m @ 200ppm.
Relationship Between Mineralisation Widths and Intercept Lengths	<ul style="list-style-type: none"> • These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the downhole lengths are reported, there should be a clear statement to this effect (e.g., 'downhole length, true width not known'). 	<ul style="list-style-type: none"> • All assay intervals are down hole length, the true width not known. • Geometry is not precisely known as out crops are partially obscured by cover, bedding dips 70° to W. • Down hole intercepts are reported. True widths are likely to be 60-70% of the down hole widths.
Diagrams	<ul style="list-style-type: none"> • Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> • See main body of report.
Balanced Reporting	<ul style="list-style-type: none"> • Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> • All other relevant data has been reported • The reporting is considered to be balanced.
Other Substantive Exploration Data	<ul style="list-style-type: none"> • Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and 	<ul style="list-style-type: none"> • The Project area has been subject of significant exploration for base metals, graphite and gold. • See body of report for details

Criteria	JORC Code Explanation	Commentary
	method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	
Further Work	<ul style="list-style-type: none"> • The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling). • Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> • Further exploration sampling geochemistry and drilling required at all prospects
